Urbanization
End of car growth*

New Mobility

How will mobility evolve in the coming decades? Is the car era drawing to a close? And what will 'sustainable mobility' look like?

In **New Mobility**, Arie Bleijenberg debunks some long-held axioms about mobility. Subsidies for public transport and electric cars are not an effective way of reducing pollution. Relieving congestion is not a good compass for a thriving economy. Bleijenberg elaborates a broad and surprising vision on the fundamental forces shaping transport mobility. Main question is: which policy measures do work in the 21st century for the economy and for combatting climate change?

Arie Bleijenberg has been involved in mobility issues for over 25 years. Through his work as a researcher, consultant and government advisor, in combination with his efforts on behalf of NGOs, he has been able to unravel the complex relationships between transport mobility, spatial planning and the economy.

Recommended

Bent Flyvbjerg, Professor and Chair at Oxford University

"New mobility is a goldmine of insights into how transportation is changing. Arie Bleijenberg should be read by anyone interested in the future of mobility and cities."

Bert van Wee, Professor of Transport Policy at Delft University of Technology

"This is a well written and to some extent provocative book. Highly recommended for everyone looking for an inspiring vision! Not only with respect to what the future of mobility should look like, but also how it should be realized."
